YINKA THEOPHILUS ADEBIMPE

Data Scientist | Data Analyst | Machine Learning · Survival Analysis · Python · SQL

United Kingdom | +44 7879 572105 | adebimpey@gmail.com | linkedin.com/in/yinka-adebimpe | github.com/YinkaAdebimpe

PROFESSIONAL SUMMARY

Data Scientist and Data Analyst with a Mathematical Sciences degree, formal training in analytics and machine learning, and proven experience using live operational and customer data to drive business decisions across fulfilment operations, regulated insurance and my own distribution business. Built end-to-end models in Python and SQL, including a renewal classifier (ROC-AUC 0.81) protecting approximately £166K in annual revenue and a survival-analysis CLV model projecting a £3.33M portfolio value. Combines technical modelling with commercial judgement, turning data into clear recommendations that reduce churn, waste and operational cost.

TECHNICAL SKILLS

- **Languages:** Python, SQL, R
- **Machine Learning and Statistics:** Classification, Regression, Time-Series Forecasting (Holt-Winters), A/B Testing, Survival Analysis (Kaplan-Meier, Cox PH), Feature Engineering, Model Evaluation (ROC-AUC, MAE); familiar with Deep Learning (TensorFlow/Keras) and NLP
- **Data and Libraries:** pandas, numpy, scikit-learn, statsmodels, XGBoost, SQLAlchemy
- **Databases:** PostgreSQL, MySQL
- **Visualisation and BI:** matplotlib, seaborn, Power BI, Tableau, Advanced Excel
- **Tools:** Git, GitHub, GitHub Actions (CI/CD), Docker, FastAPI, pytest, JupyterLab, VS Code, Salesforce
- **Professional Skills:** Data storytelling and stakeholder communication, problem solving, commercial awareness, decision-making under pressure, coaching and teamwork, attention to detail, prioritisation

DATA SCIENCE PORTFOLIO PROJECTS

GuardianShield Insurance: Data Science Consulting Portfolio | github.com/YinkaAdebimpe

Customer Renewal Prediction | Classification

- **Business problem:** customers were lapsing at renewal, eroding recurring revenue, with no way to prioritise retention spend.
- **How:** cleaned and prepared policy and customer data, engineered predictive features, then trained and compared classification models in Python (pandas, scikit-learn), validating on ROC-AUC (0.81).
- **Business impact:** ranked customers by lapse risk so retention effort targets the highest-risk segments; a 5% retention campaign on these segments protects approximately £166,000 in annual revenue.

Customer Lifetime Value | Survival Analysis

- **Business problem:** marketing budget was spread evenly because the value of each customer was unknown.
- **How:** estimated survival curves with Kaplan-Meier, modelled churn drivers with Cox Proportional Hazards regression, and converted the results into a 12-month customer lifetime value for each customer.
- **Business impact:** quantified a £3.33M portfolio value and found price-sensitive customers carry 16x higher churn risk, supporting a shift of marketing budget towards higher-value, lower-risk customers.

Claims Severity Prediction | Regression

- **Business problem:** unpredictable claim costs created reserving and underwriting risk.
- **How:** prepared claims data and benchmarked raw-target versus log-target regression across four algorithms, selecting the best model on Mean Absolute Error.
- **Business impact:** achieved a MAE of £1,937, giving more accurate reserving and protecting underwriting margins.

Customer Growth and Churn Engine | Python, scikit-learn, statsmodels, pandas

- **Business problem:** an e-commerce retailer faced a 33.4% churn rate, representing an estimated £2.97M in lost revenue.
- **How:** engineered RFM (recency, frequency, monetary) features and built a Random Forest churn model (ROC-AUC 0.785), supplemented by A/B statistical testing and Holt-Winters time-series forecasting.
- **Business impact:** simulated a targeted retention campaign delivering a net profit of £68,121 (15x ROI), and forecast £1M in monthly revenue to support proactive budget planning.

Document Intelligence Pipeline | Python, FastAPI, Docker, GitHub Actions

- **Business problem:** insurance firms need to extract structured data from thousands of unstructured claim emails without risking AI hallucinations.
- **How:** built an LLM-powered extraction API with FastAPI, validated by a Pytest golden-dataset evaluation suite, containerised with Docker and deployed through an automated GitHub Actions CI/CD pipeline.
- **Business impact:** automates manual data entry, with a mock-mode testing strategy that prevents costly API calls during development, demonstrating the full MLOps lifecycle from evaluation to deployment.

PROFESSIONAL EXPERIENCE

Process Guide, Operations and Performance Data (Amazon Associate) Oct 2023 – Present
Amazon, Doncaster, UK

- Work alongside managers and team leads as a Process Guide, using live operational data to make real-time staffing and workflow decisions that keep the site on target.
- Monitor cross-belt recirculation rates to decide when to move associates to high-volume lines or downstack goods, protecting flow and preventing backlogs.
- Rebalance labour share across units using live performance data, helping the team consistently meet daily and shift targets.
- Analyse associate error rates to identify who needs coaching, supporting quality standards across the team.
- Use workflow trends from previous peak periods to forecast demand and inform peak-period staffing.
- Completed a Diploma in Data Analytics (SQL, Python, R, Tableau, Advanced Excel) through Amazon's Career Choice programme while working full time, then applied it to build five end-to-end data science projects.

Customer Retention and Renewal Analysis (Sales and Renewals Agent) Jan 2025 – Jul 2026
Homeprotect (via Concentrix), Sheffield, UK

- Input customer, property and cover data into pricing systems to generate accurate quotes and renewal premiums tailored to each customer's circumstances.
- Analysed customer behaviour, policy history and premium changes to identify churn drivers and retention opportunities, informing retention conversations and tailored renewal offers.
- Interpreted the factors behind price movements to explain premiums clearly and negotiate renewals and keep customers on policy.
- Segmented customers by risk and engagement in CRM data to prioritise outreach to those most likely to lapse.
- Maintained data accuracy across Salesforce, TCAS and Workday within an FCA- and GDPR-regulated environment, ensuring compliant records and quotes.
- Converted frontline insight, such as price sensitivity at renewal, into hypotheses tested in my own churn and CLV models.

Support Worker Nov 2022 – Sep 2023
The Hesley Group, Doncaster, UK

- Maintained accurate daily records, incident reports and care plans in a regulated setting, achieving 100% compliance.

Founder and Managing Director (Wholesale FMCG Distribution) 2016 – 2022
Theomar Global Business Venture

- Founded and scaled a wholesale FMCG distribution business to £36,500 annual turnover, using sales and stock data to guide pricing, purchasing and growth.
- **Customer analytics:** segmented retailers by purchasing volume to prioritise key accounts and target sales effort.
- **Demand forecasting:** analysed historical sales trends to predict demand by product, reducing waste and preventing stockouts.
- **Business intelligence:** ran weekly trend analysis to adjust procurement, increasing sales velocity and improving profit margins.

EDUCATION

Diploma in Data Analytics | Pitman Training 2025 – 2026
SQL, Python, R, Tableau, Advanced Excel, Statistics, Project Management for Data Analysts, Fundamentals of AI

Expert Data Scientist Course | StackwisR London 2022 – 2024
Power BI, SQL, Machine Learning with Python, Deep Learning (TensorFlow/Keras), Feature Engineering, NLP

BSc Mathematical Sciences (2:1) | University of Agriculture, Abeokuta 2006
Linear Algebra, Calculus, Probability Theory, Statistics, Numerical Analysis
